Your Drinking Water Report

2008

MWRA BOARD OF DIRECTORS

IAN A. BOWLES, CHAIRMAN JOHN J. CARROLL, VICE-CHAIR JOSEPH A. MACRITCHIE, SECRETARY JOEL A. BARRERA KEVIN L. COTTER JOSEPH C. FOTI MICHAEL S. GOVE JAMES W. HUNT, III

MARIE T. TURNER

VINCENT G. MANNERING

ANDREW M. PAPPASTERGION

Dear Customer.

The Massachusetts Water Resources Authority is pleased to send you this year's annual report on your drinking water quality. MWRA and your local water department test thousands of water samples each week, under strict federal and state guidelines. The results for 2008 are excellent: for the 120 contaminants we test for, every standard was met.

I am also pleased to report that the lead test results for 2008 and the first half of 2009 show that system-wide, MWRA was below the federal Lead Action Level. It is important to remember that lead is not in the source water, but can enter the water through some household plumbing that contains lead. Recent tests have also shown that there are no traces of pharmaceuticals in MWRA water.

Your tap water is one of the best values around. For less than a penny a gallon, you receive some of the cleanest, best tasting drinking water in the country. That penny also provides you with experienced, professional staff who protect, treat and deliver your water and make sure it is always available.

MWRA has great confidence in the water we deliver to your home, and we want you to have the same confidence. This report contains important information, and I hope you take a moment to read through it. Please contact us if you have any questions or comments about your water quality, or any of MWRA's programs.

Sincerely,

Frederick A. Laskev

MWRA Executive Director

This report is required under the Federal Safe Drinking Water Act and provides information on:

| Where your water comes from | |
|---|---|
| Map of the water system | 2 |
| How your water is treated | 3 |
| Improvements to the system | 3 |
| Test results | 4 |
| Information about lead | 5 |
| Special notice for the immuno-compromised | 6 |
| List of further resources | 6 |

MASSACHUSETTS WATER RESOURCES AUTHORITY PWS ID #6000000 Charlestown Navy Yard Building 39, 1st Avenue Boston, MA 02129 617-242-5323 www.mwra.com

WATERSHED PROTECTION: The pristine watersheds enhance the value of the water by keeping potential pollutants out and making treatment easier.

Your water comes from the Quabbin Reservoir, about 65 miles west of Boston, and the Wachusett Reservoir, about 35 miles west of Boston. These reservoirs supply wholesale water to local water departments in 50 communities, 44 in greater Boston and MetroWest, three in western Massachusetts, and serves as a back-up supply for three others. The two reservoirs combined supplied about 206 million gallons a day of high quality water to consumers in 2008.

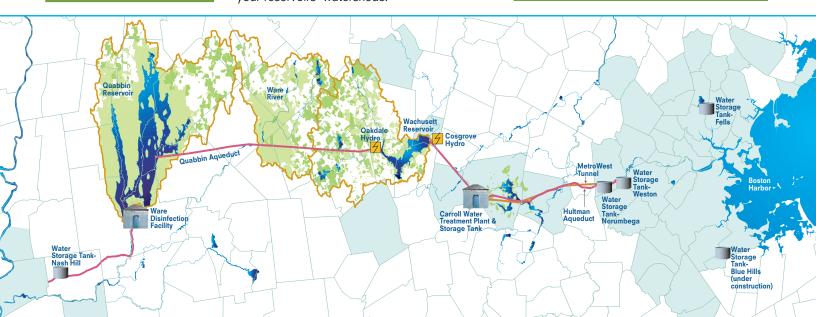

Quabbin and Wachusett watersheds are protected naturally with over 85% of the watersheds covered in forest and wetlands. About 75% of the total watershed land cannot be built on. The natural undeveloped watersheds help to keep MWRA water clean and clear. Also, to ensure safety, the streams and the reservoirs are tested often and patrolled daily by the Department of Conservation and Recreation (DCR).

Rain and snow falling on the watersheds protected land around the reservoirs - turn into streams that flow to the reservoirs. This water comes in contact with soil, rock, plants, and other material as it follows its natural path to the reservoirs. While this process helps to clean the water, it can also dissolve and carry very small amounts of material into the reservoir. Minerals from soil and rock do not typically cause problems in the water. But, water can also transport contaminants from human and animal activity. These can include bacteria, viruses, and fertilizers - some of which can cause illness. The test data in this report show that these contaminants are not a problem in vour reservoirs' watersheds.

The Department of Environmental Protection (DEP) has prepared a Source Water Assessment Program report for the Quabbin and Wachusett Reservoirs. The DEP report commends DCR and MWRA on the existing source protection plans, and states that our "watershed protection programs are very successful and greatly reduce the actual risk of contamination." The report recommends that we maintain present watershed plans and continue to work with the residents, farmers, and other interested parties to maintain the pristine watershed areas.

TAP WATER – THE GREEN CHOICE! As water travels eastward through tunnels from the Quabbin and Wachusett Reservoirs, clean hydroelectric energy is produced. The electricity generated is used to reduce MWRA's energy demands. Also, the clean, fresh water is delivered straight to your home without the fuel consumption of trucking or the waste left behind by plastic bottles.

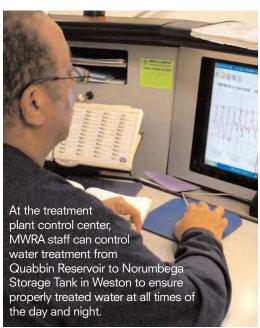

FROM THE RESERVOIR TO YOUR HOME

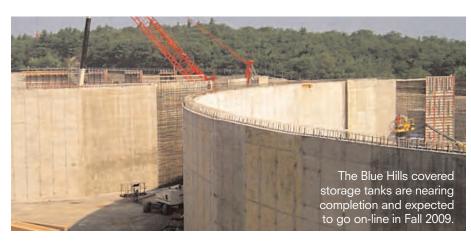

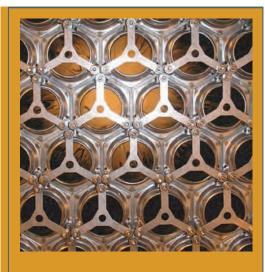

Even though tap and bottled water must meet the same standards, bottled water costs hundreds of times more -a penny for tap compared to \$1 to \$8 a gallon for bottled. Tap water must meet more intensive Environmental Protection Agency (EPA) testing requirements than bottled water, which is regulated by the Food and Drug Administration (FDA).

WATER TREATMENT STEPS

The water you drink is treated at the John J. Carroll Water Treatment Plant in Marlborough. The first treatment step is disinfection of reservoir water. MWRA's licensed treatment operators carefully add measured doses of ozone gas bubbles to the water to kill any pathogens (germs) that may be present in the water. Fluoride is then added to reduce cavities. Next, the water chemistry is adjusted to reduce corrosion of lead and copper from home plumbing (see page 5). Last, we add mono-chloramine, a mild and long-lasting disinfectant combining chlorine and ammonia, which protects the water while it is in the local pipelines.

Ozone consists of three atoms of oxygen. It is created by applying an electrical current to pure oxygen in a specially designed chamber. Ozone provides better disinfection than chlorine alone, especially against *Cryptosporidium* and other hard to kill germs. It also reduces the amount of potentially harmful chlorine byproducts.

IMPROVEMENTS TO THE WATER SYSTEM

Over the last ten years, in addition to the treatment plant, MWRA has improved watershed protection, built the MetroWest tunnel, installed covered storage tanks, and rehabbed many miles of pipeline. These projects are the largest investments since the construction of the Quabbin Reservoir in the 1930s.

MWRA and its partner communities will continue to make necessary improvements to ensure high quality water is delivered directly to the customer's tap. One high priority is rehabbing older pipes within the extensive pipe network. MWRA is upgrading its own pipes, as well as providing zero-interest loans to help communities improve their older pipes. To save money and limit traffic and service disruptions, construction crews try to clean and reline rather than replace pipes whenever possible.

WATER CONSERVATION

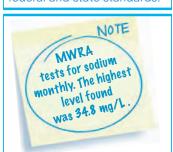

On average, each person uses about 65 gallons of water each day. There are many simple ways you can conserve water and lower your bills, including: fixing leaks, installing low-flush toilets and low-flow shower heads, or minimizing your outdoor watering. MWRA has an active conservation program, and it is paying off. Demand has dropped dramatically and water usage is lower than it has been in over 40 years. Still, there is more work to be done to conserve this precious resource. To find out more, contact the MWRA at 617-242-SAVE or visit www.mwra.com.

TESTING YOUR

WATER EVERY STEP OF THE WAY

Our professional lab staff has many years of experience and performs thousands of tests each week to make sure the water supplied meets all the federal and state standards.

(4)

This is about 9 mg per 8 oz. glass which would be considered Very Low Sodium by the Food and Drug Administration (FDA).

TESTS BEFORE TREATMENT

We test the water as it leaves the reservoir to see how well protected our watersheds are. Test results show few contaminants are found in the reservoir. The few that are found are in very small amounts, well below EPA's standards. Turbidity (or cloudiness of water) is one measure of overall water quality. Typical levels at the Wachusett Reservoir are 0.3 NTU (Nephelometric Turbidity Units). In 2008, turbidity was always below EPA's standard of 5.0 NTU. It was also below the stricter Massachusetts standard of 1.0 NTU over 99.99% of this time, with the highest level at 1.17 NTU. This did not interfere with effective disinfection. MWRA also tests reservoir water for pathogens - such as fecal coliform, bacteria, viruses, Cryptosporidium, and Giardia. They can enter the water from animal or human waste. All test results were well within state and federal testing and treatment standards.

TESTS AFTER TREATMENT

EPA and state regulations also require many water quality tests after treatment to check the water you are drinking. MWRA follows - and even goes beyond - these tests. We conduct tens of thousands of tests per year on over 120 contaminants. For a complete list of what we test for, go to www.mwra.com.

The only contaminants detected are listed below, and all met EPA's standards. The bottom line is that the water quality is excellent.

TESTS IN COMMUNITY PIPES

MWRA and local water departments test 300 to 500 water samples each week for total coliform bacteria. Total coliform bacteria can come from the intestines of warm-blooded animals, or can be found in soil, plants, or other places. Most of the time, these bacteria are not harmful. However, their presence could signal that harmful bacteria from fecal waste may be there as well. The EPA requires that no more than 5% of the samples in a month may be positive for total coliform. If a water sample tests positive for total coliform, we run more specific tests for E.coli. E.coli is a bacteria found in human and animal fecal waste and may cause illness.

TOTAL COLIFORM RESULTS

| Community | Highest % of positive samples and month | Violation of EPA's 5% limit |
|---------------------------|--|-----------------------------------|
| Framingham | 1.3% (June) | No |
| Waltham | 1.3 (April) | No |
| MWRA Transmission Line | 0.3% (August) | No |

How did we do in 2008? The table above reports test results from 30 communities that receive all of their water from MWRA. Total coliforms were found in two communities, though no community exceeded the EPA standard. For more information, please read your community letter.

Test Results - After Treatment

| Compound | Units | (MCL) Highest Level Allowed | (We found) Detected Level- Average | Range of Detections | (MCLG) Ideal Goal | Violation | How it gets in the water |
|-----------------------|-------|--------------------------------------|---|------------------------|-------------------------|-----------|----------------------------------|
| BARIUM | ppm | 2 | 0.009 | 0.008-0.011 | 2 | No | Common mineral in nature |
| MONO-CHLORAMINE | ppm | 4-MRDL | 2.0 | 0.0-3.9 | 4-MRDLG | No | Water disinfectant |
| FLUORIDE | ppm | 4 | 1.04 | 0.55-1.22 | 4 | No | Additive for dental health |
| NITRATE^ | ppm | 10 | 0.16 | 0.02-0.16 | 10 | No | Atmospheric deposition |
| NITRITE^ | ppm | 1 | 0.007 | 0.005-0.007 | 1 | No | Byproduct of water disinfection |
| TOTAL TRIHALOMETHANES | ppb | 80 | 3.7 | 0.7-7.5 | ns | No | Byproducts of water disinfection |
| HALOACETIC ACIDS-5 | ppb | 60 | 5.7 | nd-10.5 | ns | No | Byproducts of water disinfection |

KEY: MCL=Maximum Contaminant Level - The highest level of a contaminant allowed in water. MCLs are set as close to the MCLGs as feasible using the best available technology. MCLG=Maximum Contaminant Level Goal - The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. MRDL=Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. MRDLG=Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which there is no known or expected health risk. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination. ppm=parts per million ppb=parts per billion nd=not detected ns=no standard ^As required by DEP, the maximum result is reported for nitrate and nitrite, not the average.

WHAT TO KNOW ABOUT LEAD IN TAP WATER

WHAT CAN I DO TO REDUCE EXPOSURE TO LEAD IN DRINKING WATER?

Run the tap until after the water feels cold. To save water, fill a pitcher with fresh water and place in the refrigerator for future use.

Never use hot water from the faucet for drinking or cooking – especially when making baby formula or other foods for infants.

Ask your local water department if there are lead service pipes leading to your home.

Test your tap water. Contact MWRA (617-242-5323, www.mwra.com) for more tips and a list of certified labs.

Be careful of places you may find lead in or near your home. Paint, soil, dust, and some pottery may contain lead.

Call the Department of Public Health at 1-800-532-9571 or EPA at 1-800-424-LEAD for health information. MWRA water is lead-free when it leaves the reservoirs. MWRA and local pipes that carry the water to your community are made mostly of iron and steel, and do not add lead to water. However, lead can get into tap water through pipes in your home, your lead service line, lead solder used in plumbing, and some brass fixtures. Corrosion or wearing away of lead-based materials can add lead to tap water, especially if water sits for a long time in the pipes before it is used.

WHAT IS MWRA DOING TO LOWER LEAD LEVELS? WHAT CAN I DO?

In 1996, MWRA began adding sodium carbonate and carbon dioxide to adjust the water's pH and buffering capacity. This change has made the water less corrosive, thereby reducing the leaching of lead into drinking water. Lead levels found in sample tests of tap water have dropped by over 80 percent since this treatment change. Local water departments are working to

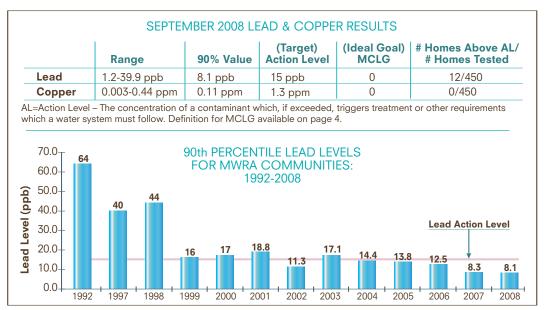

decrease lead corrosion by replacing existing lead service lines. Also, MWRA is working with city and state governments to get rid of lead in all new household plumbing, in particular faucets. Federal law still allows new faucets to contain as much as 8% lead.

To further decrease your potential exposure, you should always use cold, fresh running water for drinking or cooking and buy plumbing fixtures that have no or low lead levels. Read the labels of any new plumbing fixture closely.

MWRA MEETS LEAD STANDARD IN 2008

Under EPA rules, each year MWRA and your local water department must test tap water in a sample of homes that are likely to have high lead levels. These are usually homes with lead service lines or lead solder. The EPA rule requires that 9 out of 10, or 90%, of the sampled homes must have lead levels below the Action Level of 15 parts per billion (ppb).

Lead levels in sampled worst case homes have dramatically dropped since 1992. Over the last several years, the results have been below the EPA standard, including the last 10 sampling rounds. Results for September 2008 are shown in the table. 9 of 10 houses were below 8.1 ppb, which is below the Action Level of 15 ppb. Some communities had more than one home test above the Action Level. If you live in one of these communities, your town letter on page 7 will provide you with more information.

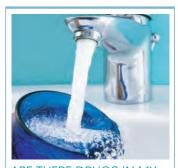

IMPORTANT INFORMATION FROM EPA ABOUT LEAD

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. MWRA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or www.epa.gov/safewater/lead.

IMPORTANT EPA & DEP INFORMATION

ARE THERE DRUGS IN MY DRINKING WATER?

Recently, you may have heard news reports about pharmaceuticals found in drinking water supplies in some parts of the country. Test results have shown no traces of drugs in MWRA's water supply. Pharmaceuticals in drinking water are more of a concern with water supplies that have wastewater discharged into them, but since MWRA's water sources are well protected, this is not a concern.

CONTAMINANTS IN BOTTLED WATER AND TAP WATER

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791) or MWRA.

In order to ensure that tap water is safe to drink, the Massachusetts DEP and EPA prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) and the Massachusetts Department of Public Health regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

ONGOING RESEARCH FOR NEW REGULATIONS

| Test | Measurement Units | 2008 Average |
|-----------------|----------------------|-----------------|
| Cryptosporidium | oocysts per 100L | 0.009^ |
| Giardia | cysts per 100L | 0.115 |
| NDMA | ng/L | 1.8* |

KEY: ng/L=nanograms per liter (parts per trillion)
^Proposed treatment threshold is 1 oocyst per 100 liters.
*The DEP "guidance value" is 10 ng/L

RESEARCH AND REGULATIONS

MWRA has been working with EPA and other researchers to define new national drinking water standards by testing for contaminants that are not regulated. Our

results will be used with those of other water suppliers to help EPA set regulations if they are necessary. In order to better understand the water supply and treated water, MWRA has voluntarily been testing for *Cryptosporidium* and *Giardia*.

DRINKING WATER AND PEOPLE WITH WEAKENED IMMUNE SYSTEMS

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have

HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk for infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Town of Framingham Department of Public Works

"Dedicated to Excellence in Public Service"

PETER A. SELLERS - Executive Director | Public Works THOMAS M. HOLDER - Deputy Director | Public Works PAUL G. BARDEN - Director of Water and Sewer

Dear Resident:

We are proud to once again provide our customers with this Consumer Confidence Report. In conjunction with the Massachusetts Water Resources Authority (MWRA), this report was compiled to provide you with information about the water that we provide to you.

The Town of Framingham operates one of the largest water systems within the MWRA service area as well as in the State. Water received from the MWRA is treated for disinfection purposes at their state-of-the-art water treatment plant. The Department of Public Works is responsible for the distribution of a public potable water supply and for the provision of fire suppression service to over 17,000 residential and commercial accounts within the community. The average daily water demand of nearly 7 million gallons per day (mgd) is purchased from the MWRA and is subsequently distributed throughout the Town via a complex distribution system that includes: 250 miles of pipe, 2,000 hydrants, 4,800 gate valves, 20,000 meters, four pumping stations, two booster stations, and six above ground water tanks having a storage capacity of nearly nine million gallons.

Twice each year the Framingham Water Department collects drinking water samples from fifteen homes which are subsequently analyzed for their lead content. The Environmental Protection Agency (EPA) has set the action level for lead in drinking water at 15 parts per billion (ppb). The results of our 2008 sampling program have successfully met that goal. The 90th percentile for lead was 7.75 ppb for the March 2008 round of sampling and 5.94 ppb for the September sampling. Please see page 5 for more information on lead in tap water.

The Framingham Water Department also performs nearly 900 bacteriological tests annually to ensure the quality and protection of your drinking water. The Town maintained continuous compliance throughout the year with the United States Environmental Protection Agency (US EPA) standards related to bacteria testing (Total Coliform Rule) but did experience 4 atypical results. Framingham is listed as testing positive for total coliform on 3 of those tests, once each during August, October, and November. Coliform is a group of bacteria most of which is harmless; however their presence in tap water is an indicator that harmful bacteria might be present. Immediate follow-up testing at the same sampling locations yielded negative results. A fourth sample tested positive for E.coli during June. The sampling site had undergone plumbing alterations just previous to the testing and it is believed that the positive result was related to that work. Repeat samples were taken and results were negative for both total coliform and E.coli. All sample testing and reporting, performed in accordance the Massachusetts Department of Environmental Protection (DEP) and US EPA standards and protocols, demonstrated that the drinking water did not contain bacteria harmful to public health. The Town works closely with water quality officials from the DEP and the MWRA when atypical results are received to ensure that public health is protected and regulatory requirements are met.

Due to a MWRA clerical error, the monthly bacteria report for May was not submitted to all DEP offices. Therefore, DEP was required to issue an Notice of Non-compliance. The test results from these reports were fine and all further reports were submitted on time.

The Department of Public Works is committed to providing all of its customers with the highest possible level of public service. As such, the quality of our water is one of our most important priorities and we welcome any questions or comments that you may have concerning that issue. For more information regarding your drinking water please visit our website at http://www.framinghamma.gov.

Respectfully,

Paul Barden | Director

Water and Wastewater Division
